Using Dashboard for innovation in Industrial Biotechnology

There is a need for information visualization tools that can map thousands of patents, technical literature etc. in Industrial Biotechnology world to fully understand the universe of organisms, enzymes, feedstock, products and by-products and the inter-relationships between them.

To solve the above problem, Dolcera builds customized dashboards, with customized categorization, for Industrial biotechnology companies helping them map innovation to the following basic variables:

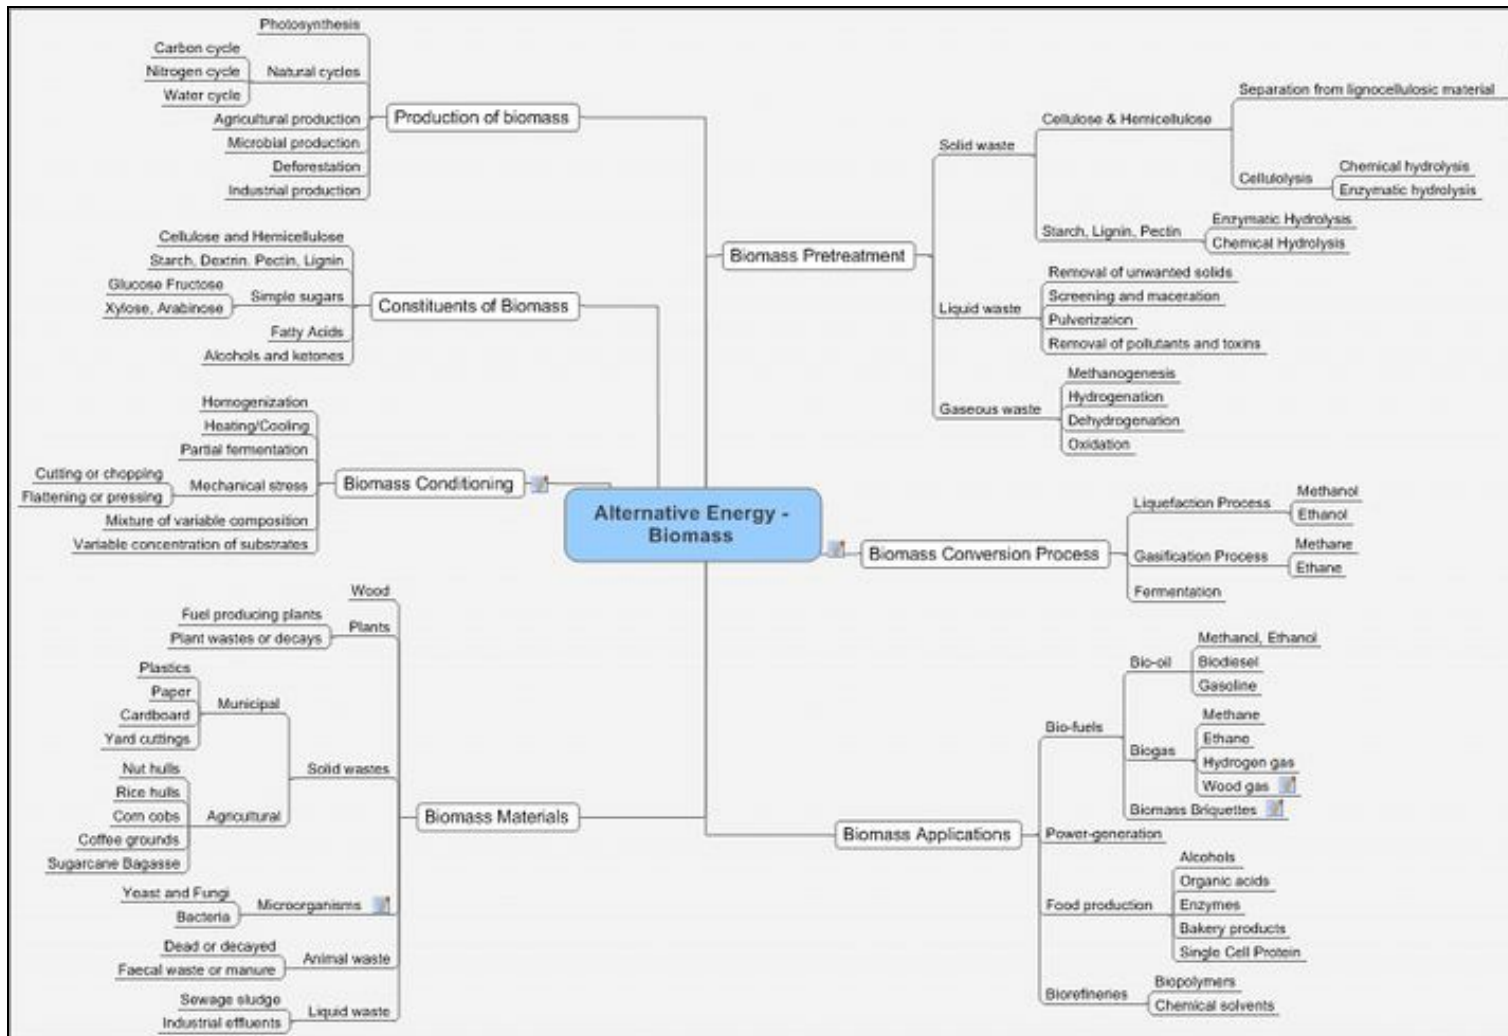

- Various feedstock
- Pre-treatment methods for feedstock
- A variety of enzymes, bacteria, fungi, yeast or a modified version of any of these that feed on feedstock
- Output or products that are obtained when the enzymes or bacteria or fungi or yeast feed on these feedstock.

Such detailed mapping of patents+technical literature activity to the above categories with the dashboard visualization tool helps companies map the entire technology landscape.

We believe that this process of mapping the technology landscape for biotechnology, albeit customized for your needs, helps companies identify white spaces that they can potentially exploit for research or patenting opportunities.

Dolcera Innovation process

Step 1 - Detailed customized categorization

Step 2 - Assigning analyzed technical documents to these categories

Step 3 - Deep dive analysis into the technical documents to identify white spaces

Catalytic upgrading of reduced crudes and residual oils with a coke selective catalyst.

The present invention is concerned with upgrading reduced crudes and residual oils with a coke selective hydrogen stable zeolite molecular sieve catalyst comprising at least 60 weight percent of alumina and pore width range in an acidic matrix and affecting regeneration thereof in an oxygen rich atmosphere under CO temperature conditions. A composition of zeolites is added to zeolite catalyst components. The regeneration of the catalyst is effected to retain up to 8.25 weight percent carbon and heat balance of the operation is limited as a function of metal promoted CO burn within a narrow fluid bed of catalyst being regenerated.
