Objective

To create a technology landscape report on **Antioxidants form Olive waste**

- Identify market players with prolific IP activity in the technology area
- Segment the players by the industry they belong to

Note: This report is just a template and gives an indication of what the paid report contains.

Search methodology

Search strategy	1. Various keywords are retrieved for conducting the search related to antioxidants from olive waste from pubmed mesh, relevant patents, scientific articles and thesaurus. 2. The database used for patent search is Thomson innovation.
Keywords	Olive waste, By-products, Antioxidants etc.

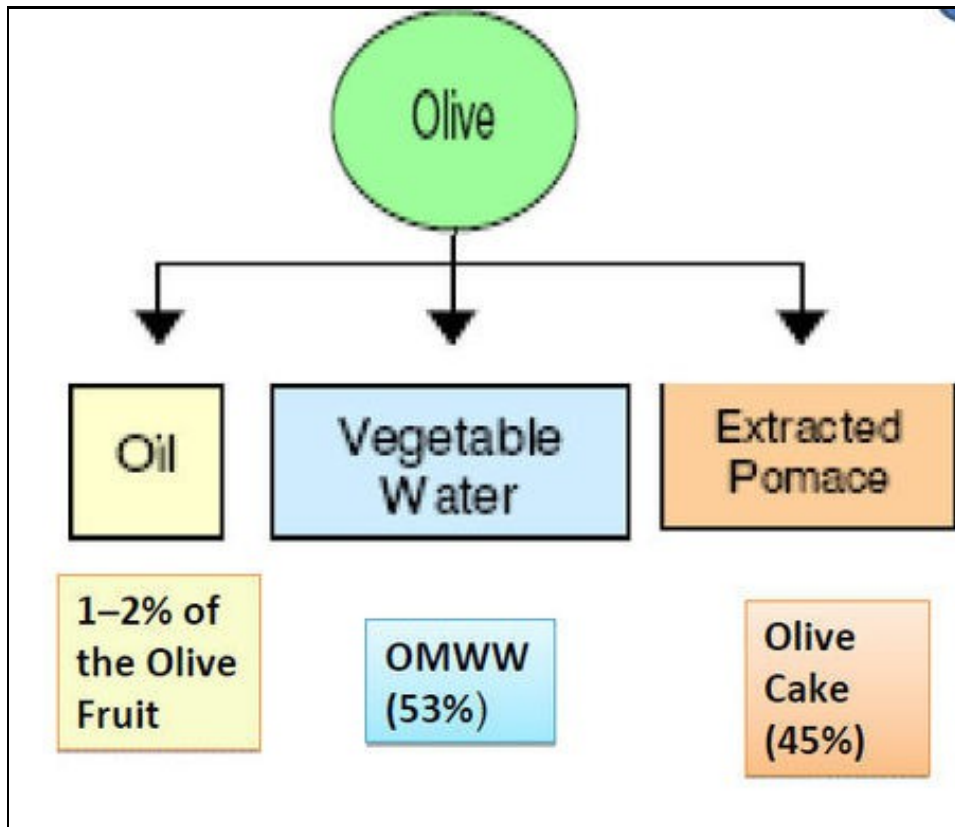

Background

Fruit and vegetable processing has increased considerably during the last 25 years and this generates substantial quantities of waste/by-products. These wastes are often disposed of as landfill, land-spreading, or as animal feed or fertilizers. But in last few years, efficient, inexpensive and environmentally sound utilization of these materials is becoming more important and hence new methods for waste handling and treatment have been introduced in the recovery, bioconversion, and utilization of valuable constituents from food wastes. [Waldron](#)

Olea europaea L. is a typical tree widely cultivated for oil production in the Mediterranean area, they are rarely consumed as a natural fruit due to their extreme bitterness hence they are widely used for the extraction of oil [Bouaziz et al.](#) This olive oil industry generates large amounts and varieties of wastes, which remain most of potentially interesting compounds.

- Olive oil production products Taka:
 - ◆ **Olive oil** (20%).
 - ◆ **Semi-solid waste** (30%)
 - ◆ **Aqueous liquor** (50%).

- **Solid waste** (olive oil **cake** (OOC) or **orujo**?) is a combination of **olive pulp** and **stones**.
- **Aqueous liquor** comes from the **vegetation water** and **alpechin** or **olive-mill waste water** (OMWW).
- Two-phase processing technique in which no water is added, generates oil and a new by-product called **alperujo**, **alpeorujo** or twophase olive mill waste? which is a combination of liquid and solid waste. [Bolanos et al](#)

Antioxidants in olive waste

During the production of olive oil 80% of the olive fruit is discarded as waste, over 10 million tons per year of solid or semisolid wastes are produced worldwide in the olive industry, whose storage and/or recycling represent a serious environmental problem due to its high content in organic matter. However these wastes are rich in **polyphenols**, including **hydroxytyrosol** [Schaffer et al](#). Olive fruits, olive leaves, olive oil and olive mill wastewater all of them have attracted considerable attention as valuable sources of biophenols [Bouaziz et al](#). Biophenolic fraction of olive oil comprises only 1-2% of the total phenolic content of the olive fruits, while the remaining 53% and 45% being lost in oil mill waste (OMW) and olive cake. Consequently, with more than **30 phenolic** compounds, OMW is now regarded as a potent source of natural antioxidants. [Taka](#)

Oleuropein is the major secoirid compound of unripe olive fruit and the glucoside of **hydroxytyrosol** is the predominant phenolic in ripe olives. Olive fruits also contain other secoiridoids such as **verbascoside** and **ligustroside**. Other groups of phenolic compounds are derived from **cinnamic** (p-cumaric, ferulic and caffeic acid) and **benzoic** acids. Other phenols found in olive pulp are **catechol**, **methylcatechol**, **phenylalchols** (tyrosol, hydroxytyrosol), high concentrations of **flavonoids** and several **anthocyanin** pigments. The main phenolic compounds present in virgin olive oil are **tyrosol**, hydroxytyrosol, its secoiridoids and conjugate forms (oleuropein, ligustroside, verbascoside) and **lignans** (pinosresinol and acetopinosresinol). During the olive oil mechanical process, the major proportion of the phenolic compounds are found in the aqueous phase, while only a minor percent (<1%) are located in the olive oil this explains why a large fraction of phenolics can be found in the **alpechin** and **alperujo**. Therefore, both residues seem to be an affordable and abundant source of natural antioxidants [Bolanos et al](#).

Polyphenols present in different parts of olive plant

Olive Bark	Olive Branches	Olive stones
Hydroxytyrosol	Hydroxytyrosol	Pinoresinol
Tyrosol	Tyrosol	Hydroxy pinoresinol
Oleuropein	Oleuropein	
Ligstroside	Verbascoside	
	Taxifolin	

Concept table

Top cited patents
Dashboard

• The assignees have been categorized into following areas:

1. Food Companies
2. Cosmetic Companies
3. Nutraceutical companies
4. Pharmaceutical Companies
5. Agriculture and veterinary nutrition Companies
6. Chemical and Biotechnology companies
7. Universities and Research Institutes

A data preview of the dashboard is shown below:

The screenshot displays a dashboard for 'Antioxidants from olive waste Information'. On the left, there are 'Data Filters' including a search bar and a tree view of categories like 'Cosmetic Industry (47)', 'Food Industry (54)', etc. The main area shows a table of patents with columns for 'Publication', 'Title', and 'Assignee'. The selected patent, EP2363135A1, is titled 'Anti-jellyfish compositions' and is assigned to 'Antonio Puig'. Below the table, a detailed view of the selected patent is shown, including its priority date (2010-03-01), first inventor (Ginestar GonzÃÂ!í JosÃÂ©), US Class (Not available), and IPC Class (A61K0033). The abstract states: 'The present invention provides the use of a topical composition comprising an effective...'. The 'Claims' section lists three claims related to the topical composition. At the bottom, there are fields for 'Rating' and 'Tags'.

EP2363135A1
Anti-jellyfish compositions

Priority Date (y-m-d): 2010-03-01
First Inventor: Ginestar GonzÃÂ!í JosÃÂ©

US Class (primary): Not available
IPC Class (primary): A61K0033

Abstract:
 The present invention provides the use of a topical composition comprising an effective...

Claims:

1. Use of a topical composition comprising an effective amount of an extract, together with appropriate topical pharmaceutically and/or acceptable carriers and/or excipients, for avoiding the sting of poisons that contain cnidocysts.
2. Use of the composition according to claim 1, wherein the cnidocyst organism selected from the group consisting of Cnidaria and Myxozoa.
3. Use of the composition according to any of the claims 1-2, wherein is selected from those that contain glycyrrhizate, hydroxytyrosol and...
